Today we'll talk about ...

- The impetus, structure, and deliverables of our project
- The learnings reported by our “experts”
- Current findings and implications for your practice

Hello!

Who are you?

Survey: <http://bit.ly/infosurvey18>

Hello!

We're Kristin Fontichiaro
and Wendy Stephens.

Supporting Librarians in Adding Data Literacy Skills to Information Literacy Instruction

Made possible in part by the Institute of
Museum and Library Services RE-00-15-0113-
15

Core Personnel

Kristin Fontichiaro, PI, UMich School of Information (UMSI)

Jo Angela Oehrli, Co-PI, UMich Library

Amy Lennex, Project Manager

Tyler Hoff, Project Assistant, UMIS

Kelly Hovinga, Project Assistant, UMSI

Martha Stuit Project Assistant, UMSI

Curriculum Experts

Debbie Abilock, NoodleTools

Susan D. Ballard, National Center for Digital Equity

Tasha Bergson-Michelson, Castilleja School

Jennifer Colby, Huron High School

Jole Seroff, Castilleja School

Susan Smith, Harker School

Wendy Steadman Stephens, Jacksonville State University

Connie Williams, ret. from Petaluma High School

Data Experts

Jacob Carlson, UMich Library

Lynette Hoelter, ICPSR

Justin Joque, UMich Library

Special Contributors/Guest Presenters

Tuvya Bergson-Michelson,
Lick-Wilmerding School

Catherine d'Ignazio, Emerson College

Charissa Jefferson, Cal. State Northridge

Diego Mendez-Carbajo, Illinois Wesleyan

Katrina Stierholz, FRED/Federal Reserve
Bank of St. Louis

Justin Schell, UMich Library

Tierney Steelberg, Guilford College

Samantha Viotty, formerly Emerson
College, currently Obama Foundation

Andrew Whitehead, Assn. of Religion
Data Archives / Clemson University

DATA LITERACY

*The ability to “read” and “write
with” data*

slides: bit.ly/btn-data-lit

Project Overview

Turn and Talk:

What do you tell your students/learners about how to read a scholarly article?

Turn and Talk:

What do you tell your students/learners about how to read a scholarly article?

Share out ...

1. “I just tell them to read the text and skip the numbers.”

2. Bad Infographics.

3. Belief that 2016 would mirror 2012 election, with campaigns rich with data and stats and with microtargeting of voters. Were high schoolers ready to be voters?

4. Emergence of Big Data and automated, non- human, algorithmic decision-making

5. Growing focus on research
data management / data
repositories / data
information literacy at
U-M Library

With that in mind,
let's look back at
our survey results

**Data/stats
comprehension**

Data in arguments

Data visualization

**Big Data /
Citizen Science**

Ethical data use

**Personal data
management**

We planned

2 virtual conferences

One short “rules of thumb”
book

Project evaluation

We ended up with

3 virtual conferences

2 books, totalling nearly
700 pages

Project evaluation
(in process)

(8-book series for middle-
grade readers)

4T Virtual Conference on Data Literacy

- Two-day event for each of 3 years
- Free & online
- 2016 & 2017 focused on one of 3 corresponding annual themes
- 2018 open topics (co-sponsor ICPSR)
- Technically focused on high school librarians and educators, but ~ 2/3 of population over 3 years were *not* in this group

Introduction to Statistical Literacy / Lynette Hoelter

Statistical Storytelling: The Language of Data /

Tasha Bergson-Michelson

Using Data in the Research Process / Jole Seroff

Real world data fluency: How to use raw data / Wendy Steadman

Stephens

Manipulating data in spreadsheets / Martha Stuit

Making Sense of Data Visualization / Justin Joque

Data presentation: Showcasing your data with charts and graphs /

Tierney Steelberg

Deconstructing data visualizations: What every teen should know /

Susan Smith

Designing your infographic: Getting to design / Connie Williams

Using data visualizations in the content area / Jennifer Colby

Teaching Data Contexts: An Instructional Lens / Debbie Abilock

Diving Lessons: Taking the Data Literacy Plunge Through Action

Research / Susan D. Ballard

2.

What the curriculum team
learned

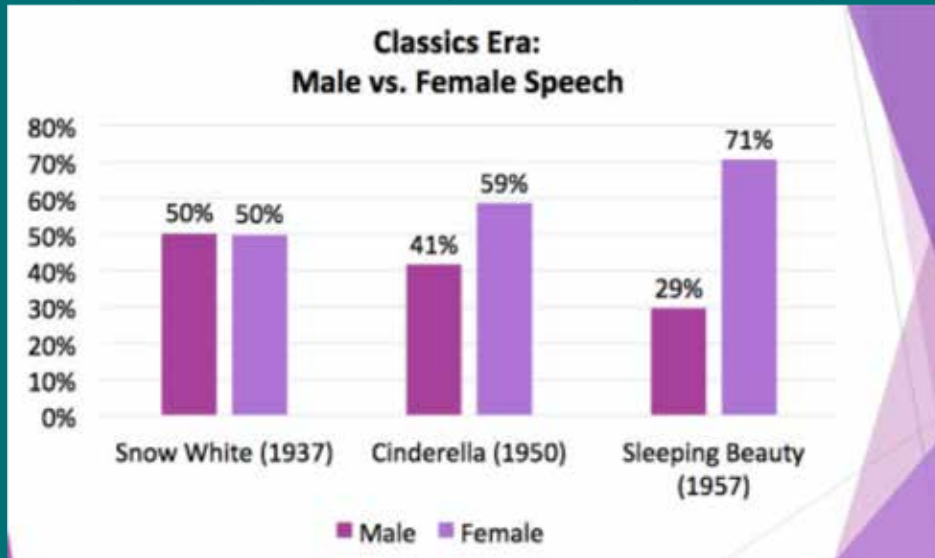

Thinking about numeracy

Variables and ambiguities

Interrogating the data

“47 percent pay no taxes”

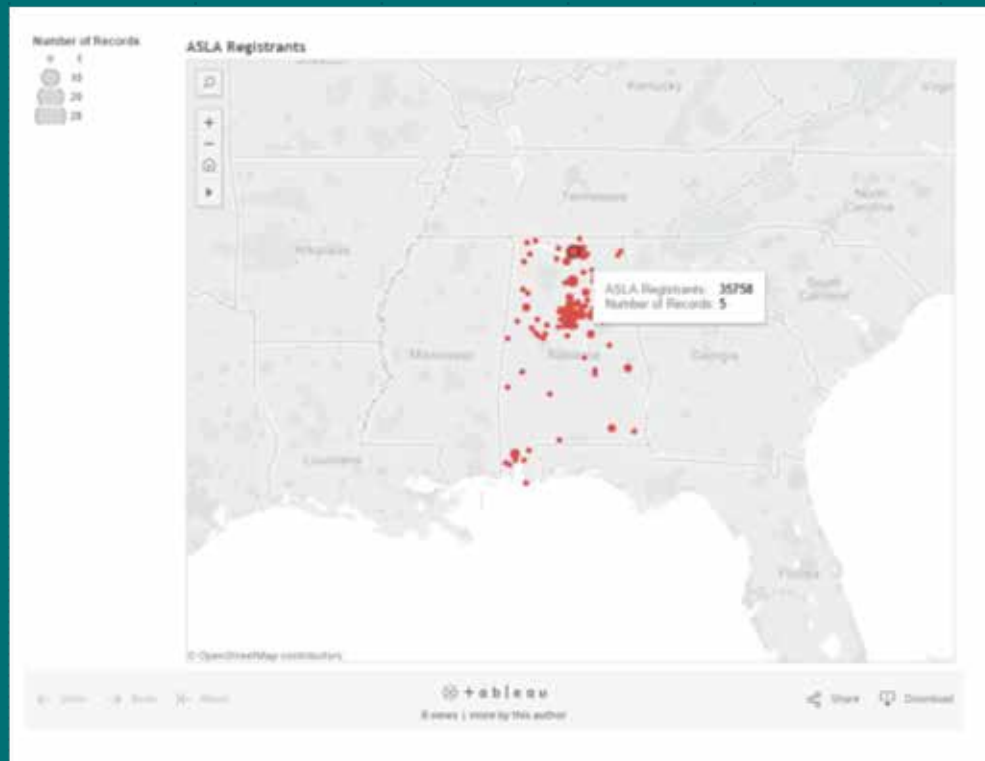

“Majority think nuclear power safest”

“Twenty percent support it”

Cut-and-paste without context

tableau public

Making responsible use of data

Google Books Ngram Viewer

Graph these comma-separated phrases: Case-insensitive

between: and from the corpus: with smoothing of [Search this set of books](#)

Data fluency

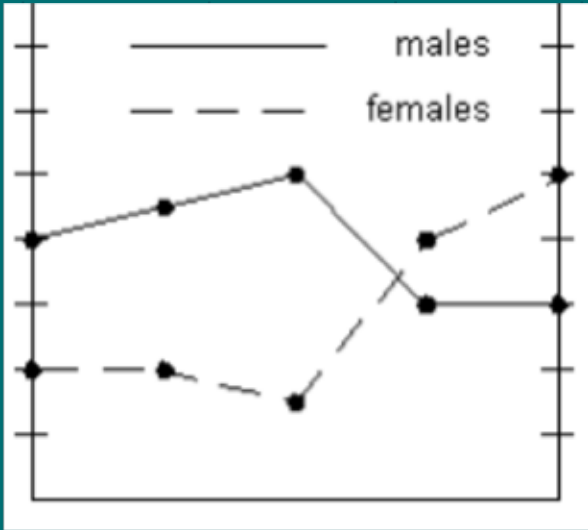

- Thinking computationally
- Finding existing data sets
- Traveling backward from news' accounts and soundbites
- Are the parameters explicit?
- Making responsible use of data

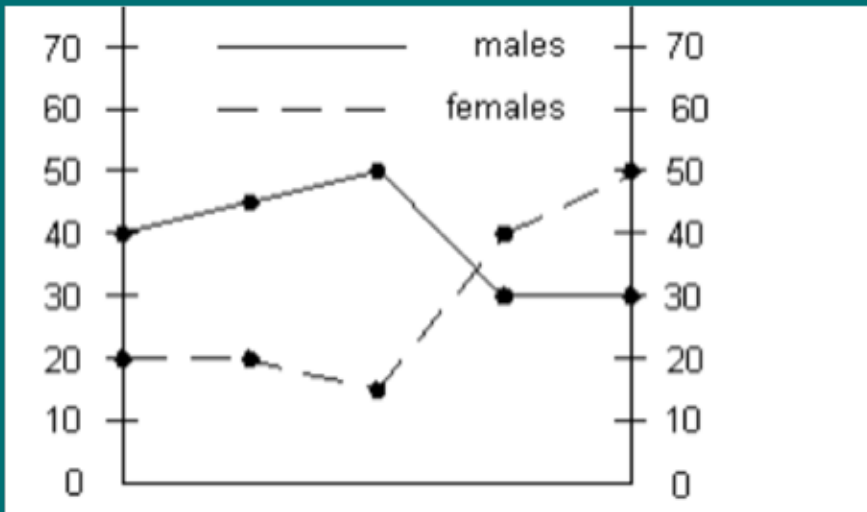

Trends

Labels

Values

Key

Of the **100 people** in
the global village

- 61 are from Asia
- 13 are from Africa
- 12 are from Europe
- 8 are from South and
Central America
- 5 are from Canada
and the U.S.
- 1 is from Oceania

Population Distribution

Of the **100 people** in the global village

What we've learned so far
from a project perspective

A little data lit goes a long
way.

REAL STRATEGIES TO ADDRESS FAKE NEWS

LIBRARIANS, DATA LITERACY AND THE POST-TRUTH WORLD

IN THE NEWS

<http://www.fnnfake.com> (fictional) and <http://www.fnnfake.com> (real)

What is Fake News?

The term "fake news" has been used in a lot of situations. For the purpose of our work, fake news can be any of these 3 things:

- *Fake News: Manipulated media content. Many times this material is created online by content farms and shared on social media.
- *Fake News: Authentic news stories labeled as fake by some politicians who think it is unfavorable to themselves.
- *Bad Information: Discouraging, dishonest headlines and/or news created by well-intentioned folks who don't know any better.

About the Project.

In what were once called a "post-truth world," students seem to focus on numbers a lot. Students believe that if a number is associated to information, it has to be a fact. But numbers are manipulated all of the time. We want students to have a tool kit of questions that they can use to question the data that is out there.

Supporting Librarians in Adding Data Literacy Skills to Information Literacy Instruction is a two-year project running from October 2015 through September 2017. It is designed to develop the data and statistical literacy skills in high school librarians so they can better support critical information skills in their students. You can find more information at <http://data literacy.com>.

This project was made possible in part by the Institute of Museum and Library Services #E-00-15-0113-10.

What is Being Counted?

When you look at research being presented as news, make sure you know who was studied, how they were selected, and what data points were being counted.

For example, when unemployment numbers are reported in the news, consider who was counted as unemployed. Does that include retired parents? Children under 18? People who aren't looking for jobs any more? To see how the U.S. calculates unemployment, see the Bureau of Labor Statistics. For international guidelines, consult the International Labour Organization's reports.

<https://www.bls.gov/news.release/unempz1.t01.htm>

SPECIAL COVERAGE

Don't Settle for Average!

"Average" is sometimes used as a synonym for three distinct mathematical calculations: mean, median, and mode. Knowing the difference can help you see "how was this average calculated?"

Mean = Adding up all numbers and dividing by the quantity of numbers.
Median = Middle Number.
Mode = Most Common Number.

When considering statistics with major outliers, the mean may show you outside the majority of numbers. Think about calculating the mean of 99 Gates' net worth with that of every U.S. citizen. The result is so massive it would head the "average" way too high! Calculating the median would give a much more realistic number. Mode could help us know where there are clusters of identical car models, which might help us identify trends for further inquiry.

Causation ≠ Correlation.

Because of headlines saying one thing causes another, that degree of certainty is very difficult to achieve. It's more likely correlation (two variables moving in sync with one another, but without knowing for certain that there isn't coincidence or other factors involved).

For example, just because people in a certain geographic area consumed coffee for information about its symptoms, doesn't mean that fatigue can produce its benefits. There could be other factors involved.

<http://www.google.com>

Where is this Data Coming From?

Is the data coming from a reliable source? Did they try to find out?

Consider the chocolate milk research that came out in 2016. Chocolate milk was supposed to cause constipation. There was a study conducted at the University of Maryland, a respected university. It turns out that the study was paid for by the dairy industry, the study wasn't peer reviewed, and there are some serious questions about the design of the study. For the purposes of the study used to to determine their product and many other vitamins were bought. Researchers are supposed to declare any potential conflicts of interest. And this researcher didn't.

RECOMMENDED

Are You Comparing Apples to Apples?

Is the comparison using the same unit of measurement? Time periods? Is it fair to compare these two (or many) things?

For example, is it fair to compare the 2008 video streaming membership of the music industry to the 2017 membership? Video streaming income peaked and rose in 2017 then it was in 2008. When comparing 1.2 million streaming DVD movies in 2017 to 1.2 million in 2008, you are not comparing apples to apples.

<http://www.cnn.com/2017/05/25/tech/streaming-video/index.html>

When was the data collected?

Is the data you're looking at still relevant? Is it fair to use the data you're reading in another situation? It's important to discover the cost of college today, make sure they have current data!

IN THE NEWS

Pie Charts Should Add Up To 100%.

Sometimes they don't...

<http://www.fox.com/2012/05/25/2012-presidential-rumor/>

POPULAR

If It's Too Good to Be True, It Probably Is!

If what you're reading includes statistics, what are you looking for should question it!

<http://www.fox.com/2012/05/25/2012-presidential-rumor/>

So... if you really want to believe that Coca Cola is good for you so that you can keep drinking it by the gallon, and then you read that it causes cancer, take a moment to read about!

Be Aware of How Color, Font, and Design Elements May Be Swaying Your Reaction to Graphical Content.

Is there a lot of red in a visualization? How does that make you feel? Is the font in the image the same as the font on warning signs? Graphic design elements can cause a knee-jerk reaction that the data itself may not support. Notice emotional elements and check yourself to see if they are supported by the data.

Keep an Eye on the Y-Axis.

The y-axis is the vertical axis, usually labeled on the left side of a graph. Look at the intervals on the y-axis. Are they at the same interval throughout the graph? Does it start with zero? Are the numbers increasing or decreasing? How does that impact your reading of the graph?

Gun deaths in Florida

<http://www.floridastatistics.com/gun-deaths-in-florida/>

MOST RECENT

Is That a Big Number? Compared to What?

Have some ready reference numbers in your toolkit and be ready to compare any number you encounter to the ones you already know. These numbers are known as statistical benchmarks. For example:

- * U.S. Population: 325 million (U.S. Census 2017)
- * World population: Just over 7.3 billion (U.S. Census 2017)
- * Number of U.S. births each year: Just under 4 million (NICHD 2016)

Know the statistical benchmarks that impact your world. Consider that if jobs in the average industry are an important aspect of the news, you should know that the coal industry employs approximately 10,000 people and that the number is declining. Alternatively, the solar industry employs 100,000 people... and it's rising! (<http://www.itw.com/energy/industry/>)

<http://www.fox.com/2012/05/25/2012-presidential-rumor/>

<http://www.fox.com/2012/05/25/2012-presidential-rumor/>

Is the Evidence Biased?

Big Data is used to make a lot of claims. But Big Data algorithms can be based on biased data. For example, software used to predict criminality has been proven to be biased against African-Americans. Don't assume that Big Data is infallible - there could be implicit bias hiding beneath its algorithms.

REAL STRATEGIES FOR LIBRARIANS

IN THE NEWS

MEAN MEDIAN MODE

Don't Settle for Average!

"Average" is sometimes used as a synonym for three distinct mathematical calculations: mean, median, and mode. Knowing the difference can help you understand how the average is calculated.

Mean - Adding up all numbers and dividing by the quantity of numbers
Median - Middle Number
Mode - Most Common Number

When considering statistics with major outliers, the mean may show you outside the majority of numbers. Think about calculating the mean of 500 sales of new cars with that of every U.S. citizen. The result is so massive it would mask the "average" way too high! Calculating the median would give a much more realistic number. Mode could help you know where there are clusters of identical car models, which might help you identify trends for further inquiry.

Causation ≠ Correlation

Because of headlines saying one thing causes another, it's easy to think that one thing causes another. But correlation does not mean causation. For example, just because people in a certain area have a higher rate of cancer doesn't mean that the area causes cancer. There could be other factors involved.

Be Aware of How Color, Font, and Design Elements May Be Swaying Your Reaction to Graphical Content.

Is there a lot of red in a visualization? How does that make you feel? Is the font in the image the same as the font on warning signs? Graphic design elements can cause a false perception that the data itself may not support. Tailor structural elements and check yourself to see if they are supported by the data.

Keep an Eye on the Y-Axis.

The y-axis is the vertical axis, usually labeled on the left side of a graph. Look at the intervals on the y-axis. Are they at the same interval throughout the graph? Does it start with zero? Are the numbers increasing or decreasing? How does that impact your reading of the graph?

Gun deaths in Florida

Is That a Big Number? Compared to What?

Have some ready references to compare any number you already know. For example, the U.S. population is 312 million people and that the number is only 10% of the total population (31.2 million).

Gun deaths in Florida

Number of murders committed using firearms

Almost everybody is
concerned about data
literacy.

1. Asking **questions** (for science) and **defining problems** (for engineering)

2. Developing and using **models**.

3. Planning and carrying out **investigations**.

4. Analyzing and interpreting **data**.

SCIENTIFIC AND ENGINEERING PRACTICES

National Research Council. 2012. A Framework for K-12 Science Education: Practices, Crosscutting Concepts, and Core Ideas. National Academies Press, p. 41. <http://arab.ck12.org/2012>. Accessed from National Academies Press and used with permission. Source.

5. Using **mathematics** and **computational thinking**.

6. Constructing **explanations** (science) & **designing solutions** (for engineering)

7. Engaging in **argument** from **evidence**.

8. Obtaining, evaluating, and **communicating** information

Almost anyone can
benefit from data
literacy.

“The Data Geek series supports the new curriculum standards that focus on understanding, interpreting, and gathering data. Information in each book is designed to help readers explore all kinds of data and data sources in order to objectively understand data in the 21st century. Readers are encouraged to think critically about the ways data is used in their lives and in the media ... Grades 4-7.”

<https://cherrylakepublishing.com/shop/show/50829>

Statistical benchmarks offer a foundation for meaningful comparison.

Data literacy is a prerequisite to larger areas of study like data science, data crunching, or lab-based research.

Entering a data literacy
conversation via
faculty/student
perceptions of pain points
is effective.

Variation: framing data lit
around existing
curriculum.

Addie Matteson

@queenaddie

All of today's session were very interesting (and maybe a little scary). My school already puts a lot of time and resources into teaching our kiddos about being safe on the internet, but I don't think we specifically address how data about them is being accumulated. After today, I feel like that's an inexcusable oversight.

Great stuff. Can't WAIT to hear from Tuvya tomorrow!

Master of Applied Data Science

Coming in
Fall 2019

M | UMSI

<http://bit.ly/umsi-mads>

Takeaways:

1. The need for quality data literacy education is everywhere (e.g., K-12, university departments, not-for-profits), and a little goes a long way.
2. Look for “pain points” with faculty that you can solve with data literacy education (e.g., data viz).
3. Recognize that before a student or librarian can tackle datasets or scholarly articles, they may need guidance in data lit principles (can our deliverables help?).
