

February 2003

# Aid, Trade, and Agriculture

he current round of multilateral trade negotiations among members of the World Trade Organization (WTO)—launched in Doha, Qatar, in 2001—has been termed the Doha Development Agenda, signifying the intention to focus on development objectives in the world trading system. One of the most important and difficult issues in that agenda is the reform of agricultural policies. Specific reform proposals and objectives are due to the WTO's Committee on Agriculture March 31, 2003, and the topic is to be included in the agenda of the ministerial meeting in Cancun, Mexico, this September.

Agricultural supports take several forms, and the levels of support vary greatly across countries. They are most prevalent, however, among the world's industrialized economies. The Organization for Economic Cooperation and Development estimates that direct and indirect transfers from consumers and taxpayers to farmers in member countries totaled over \$230 billion in 2001, comprising nearly a third of all farm receipts. Support levels range from a low of 1 percent of farm receipts in New Zealand to a high of 69 percent for Switzerland. Japan, Korea, and Norway are also near the high end of the range, while support levels in Canada, the United States, and the European Union fall somewhere between the two extremes at 17 percent, 21 percent and 35 percent, respectively.

The costs of farm supports are borne primarily by consumers and taxpayers in the industrial countries, as well as by farmers in the developing world. Protectionist agricultural policies in industrial countries tend to keep domestic prices high, so their elimination would enhance consumers' purchasing power. In addition, subsidies tend to increase the total supply of farm products to world markets, driving down international food prices and depressing the incomes of farmers in the developing world. More fundamentally, as with all protective trade policies, agricultural subsidies lead to an inefficient allocation of resources: Countries are induced to specialize in areas that are not necessarily to their comparative advantage.

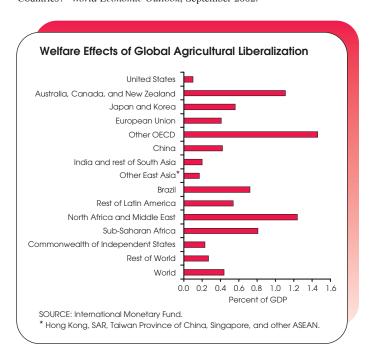

Officials of major international organizations have emphasized the importance of reducing agricultural supports as part of an overall development agenda. It is often noted that total transfers from consumers and taxpayers to farmers amount to six times the total overseas development aid offered by the industrial countries, and the vast majority of the world's poor are farmers in developing countries whose product prices are depressed by farm-support programs in industrial countries.

Because the costs of farm-support programs are diffuse, the benefits of eliminating these programs would be dispersed widely around the world. A recent International Monetary Fund study calculated the potential gains of eliminating all agricultural support, in both industrial and developing countries: Worldwide, total potential benefits would be \$128 billion, over 0.4 percent of total world GDP.¹ The accompanying chart shows that these gains would accrue to residents of every part of the globe.

Reducing the level of trade-distorting agricultural support is a complex issue, and there are powerful interests in maintaining subsidies. However, the magnitude of potential benefits from making the world's agricultural sector more efficient suggests that reducing trade-distorting farm policies is well worth pursuing.

-Michael R. Pakko

Notes and Sources

- 1. Charts and tables contain data that were current through January 2003. Unless otherwise indicated, data are quarterly.
- 2. The *percent change* refers to the percent change from the same period in the previous year. For example, the percent change in x between quarter t-4 and the current quarter t is:  $[(x_t/x_{t-4})-1] \times 100$ .
- 3. All data with significant seasonal patterns are adjusted accordingly.

#### **Notes**

Euro-Area Data: On January 1, 2001, the euro area was enlarged to include Greece as its 12th member country. Historical euro area series for capacity utilization, the consumer price index, current account balance, earnings, employment, government debt and budget balance, gross domestic product (GDP), industrial production, merchandise trade, the producer price index, and unemployment include Greece. The series for interest rates, monetary aggregates, the real effective exchange rate, retail sales, and the stock exchange index incorporate Greece starting in January 2001.

Euro-area interest rates prior to December 1998 are calculated on the basis of national government yields weighted by GDP. Starting in 1999, short-term rates are euro interbank offered rates. Long-term rates are calculated on the basis of national government bond yields weighted by the nominal outstanding amounts of government bonds in each maturity band.

The euro/dollar exchange rate used in the chart on page 12 is a synthetic rate prior to January 1999. This is constructed by calculating a weighted average of the exchange rates of the euro-area countries, excluding Greece and Luxembourg, against the dollar. The weights are based on 1997 GDP shares.

**German Data**: As a result of reunification, data for all of Germany are now incorporated in the statistical series. The starting periods for unified German data are listed below. Care should be exercised when interpreting the data around these break periods.

Third quarter 1990: current account balance, international trade, and unemployment.

First quarter 1991: consumer price index, GDP, industrial production, output per worker.

Third quarter 1992: capacity utilization. First quarter 1993: stock exchange index. Third quarter 1993: employment. First quarter 1995: hourly earnings.

Capacity Utilization covers the manufacturing sector for Canada, France,

Japan, the United Kingdom, the United States, and the euro area; manufacturing excluding food, beverage, and tobacco for Germany; and mining and manufacturing for Italy.

Consumer Price Index is for all items. The current index is based on goods and services consumed by all individuals for Canada; all multi-person households excluding those mainly engaged in agriculture, forestry, and fisheries for Japan; all households except pensioners dependent on state pension and high income households for the United Kingdom; and all urban households for the United States. Data for the euro area, France, Germany, and Italy are based on the harmonized index of consumer prices.

**Current Account Balance** is the sum of merchandise and service exports and income receipts on domestic assets abroad minus the sum of merchandise and service imports and income payments from foreign assets in the domestic economy plus net unilateral transfers.

Earnings are based on hourly earnings in manufacturing for Canada, Germany, the United States, and the euro area; hourly earnings in manufacturing excluding construction for France, hourly earnings in industry excluding construction for Italy; monthly earnings in manufacturing for Japan; and weekly earnings in manufacturing for the United Kingdom.

The **Exchange Rate** for all countries except the United States is expressed as units of local currency per U.S. dollar. For the United States the trade-weighted exchange rate, **TWEX**, is used. This is a weighted average of the exchange value of the U.S. dollar relative to the major international currencies—the euro, Canadian dollar, Japanese yen, British pound, Swiss franc, Australian dollar, and Swedish kronor. Prior to 1999, the currencies of the euro-area countries (with the exception of Greece) are used instead of the euro.

**Real Effective Exchange Rate** uses normalized unit labor costs in manufacturing. The weighting scheme used to construct the rates, for all except the euro area, is based on disaggregated data for trade among 21 industrial countries

in manufactured goods for 1995. For the euro area the weights relate to the trade of the euro area with the other countries. The weights reflect the relative importance of a country's trading partners in its direct bilateral trade relations and competition in third markets. Normalized unit labor costs in manufacturing are calculated by dividing an index of actual hourly compensation per worker by a five-year moving average index of output per man-hour.

**Employment** data refer to civilian employment for Canada, Germany, Italy, Japan, and the United States; industrial employment for France; and total employment for the euro area and the United Kingdom.

**Foreign Exchange Reserve** data are end of period. The dollar value of reserves may fluctuate as a result of changes in reserve holdings and/or changes in the value of the currencies held vis-à-vis the U.S. dollar.

Government Budget Balance is the difference between general government current receipts and total outlays. Total outlays consist of current expenditures and net capital expenditures. Government Debt incorporates all financial liabilities of the general government sector. The general government sector consolidates the accounts of the central, state, local, and social security sectors.

Inflation Differential is the U.S. inflation rate minus the foreign inflation rate, as measured by the consumer price index. For the U.S. chart on page 41, the inflation differential is the U.S. inflation rate minus a weighted average of the inflation rates in countries whose currencies are used in the major currency trade-weighted exchange rate index. Starting in 1999, the euro-area harmonized consumer price index is used for the euro area. Prior to 1999, the inflation rates for the individual euro area countries (excluding Greece and Luxembourg)

**Industrial Production** measures the change in the volume of output in the mining, manufacturing, oil, electricity, gas, and water industries.

The **Short-Term Interest Rate** table on page 4 uses the relevant 3-month interest rate shown in the country pages.

The **Long-Term Interest Rate** table on page 4 uses the government bond rate. The government bond rate is a composite of yields on federal government bonds with maturities of more than 10 years for Canada and the United States; long-term public and semi-public sector bonds for France; 7- to 15-year public sector bonds for Germany; 15- to 20-year government bonds through 1990 and 10-year government bonds starting in 1991 for Italy; and 10-year government bonds for the euro area, Japan, and the United Kingdom.

The **Reserve Money** table on page 4 refers to the adjusted monetary base for Japan and the United States; reserve money for Canada; and M0 for the United Kingdom. **Reserve Money** is currency in circulation, deposits of the deposit money banks, and demand deposits of other residents (with the exception of the central government) with the monetary authority.

#### **Adjusted Monetary Base**

Japan: currency in circulation and current deposits at the Bank of Japan. United States: the sum of currency in circulation outside Federal Reserve banks and the U.S. Treasury, deposits of depository financial institutions at Federal Reserve banks, and an adjustment for the effects of changes in statutory reserve requirements on the quantity of base money held by depositories.

#### M0

United Kingdom: notes and coins in circulation outside the Bank of England and bankers' operational deposits at the Bank of England.

#### $\mathbf{M}$

Canada: currency in circulation and chartered bank net demand deposits. Japan: cash, currency in circulation, and deposit money. Euro area: currency in circulation and overnight deposits.

#### **MZM**

United States: currency in circulation, travelers' checks, total publicly-held checkable deposits minus cash items in the process of collection and Federal Reserve float, savings deposits, shares in retail money market mutual funds (funds with initial investments of less than \$50,000), net of retirement accounts, and institutional money market mutual funds.

#### International Economic Trends

#### M2

Canada: M1 plus all checkable notice deposits and personal term deposits. United Kingdom: currency in circulation and sterling retail deposits with the U.K. banks and building societies.

United States: MZM less institutional money market mutual funds plus small denomination (less than \$100,000) time deposits.

#### M2 + CDs

Japan: M1 plus private deposits, public deposits less demand deposits, and certificates of deposit.

#### **M3**

Euro area: M1 plus deposits with a maturity up to 2 years, deposits redeemable at notice up to 3 months, repurchase agreements, money market funds, and debt securities up to 2 years.

#### M4

United Kingdom: M2 plus wholesale deposits with the U.K. banks and building societies.

Output Per Worker is the ratio of real GDP to employment.

**Producer Price Index** covers manufacturing for Canada and the United Kingdom; and total industry for Japan and the United States. Data for the euro area, France, Germany, and Italy are based on the harmonized index of total industry excluding construction.

**Retail Sales** are based on a volume index. The percent change in retail sales for the United States is based on the Standard Industrial Classification system through 1992 and the North American Industrial Classification System from 1993 on.

**Stock Exchange Index** refers to all share prices except for the United Kingdom, which excludes financial firms.

**Unemployment Rate** is the standardized unemployment rate. It is the percentage of the civilian labor force that is unemployed. The unemployed are all persons of working age who are without work, readily available for work, and actively seeking work. The standardized rate may differ from the national unemployment rate calculations.
